## **SNAIL SLIME EXTRACTION PROCEDURE**

**1.1 Fasting.** The snails are submitted to fasting for 7 days.

**1.2 Stimulation.** To obtain an abundant and correct segregation of snail slime, the snails are submitted to a process of stimulation by means of a treatment with thermal mud acids, which have been previously prepared, dried and pulverized.

**1.3 Filtration and sterilization.** The filtration is realized by gravity and the sterilization by means of a formol donor.

**1.4 Addition of preservatives.**

**1.5 Addition of different actives.** The product is enriched with a series of actives which are incorporated in a propilenglicol dissolving agent and water.

**1.6 Standardization.** It is carried out so that the physiochemical characteristics are always the same and conform to the established parameters
